Hands-on: explore the cohort

Wednesday 23 September 2026 · 15 minutes · pairs welcome · nothing to submit

Name(s): _____

Working from `week01_handson.ipynb`, or from a neighbour's screen. Useful: `.value_counts()` `.groupby()` `.size()` `.mean()` `.sort_values()` `.isna()`

1 How many patients are in the dataset, and what is the male / female split?

2 What are the five most common conditions, by count of records?

3 What is the average number of encounters per patient?

Then look at the distribution. Does that average describe a typical patient?

4 Pick one patient. List their conditions in chronological order.

Patient Id: _____

5 Find one thing that looks *too clean* to be real data.

No code needed. Real hospital extracts contain missing values, typos, duplicate patients, impossible dates, and free-text fields containing anything at all. One sentence:

Nothing to submit. ***Lab 1 is Friday 2 October.*** *Bring a laptop with Python and pandas working. Materials: github.com/kon0925/hy489*
